

Modular RAGs

Finn Vilsbæk

fvil@eadania.dk

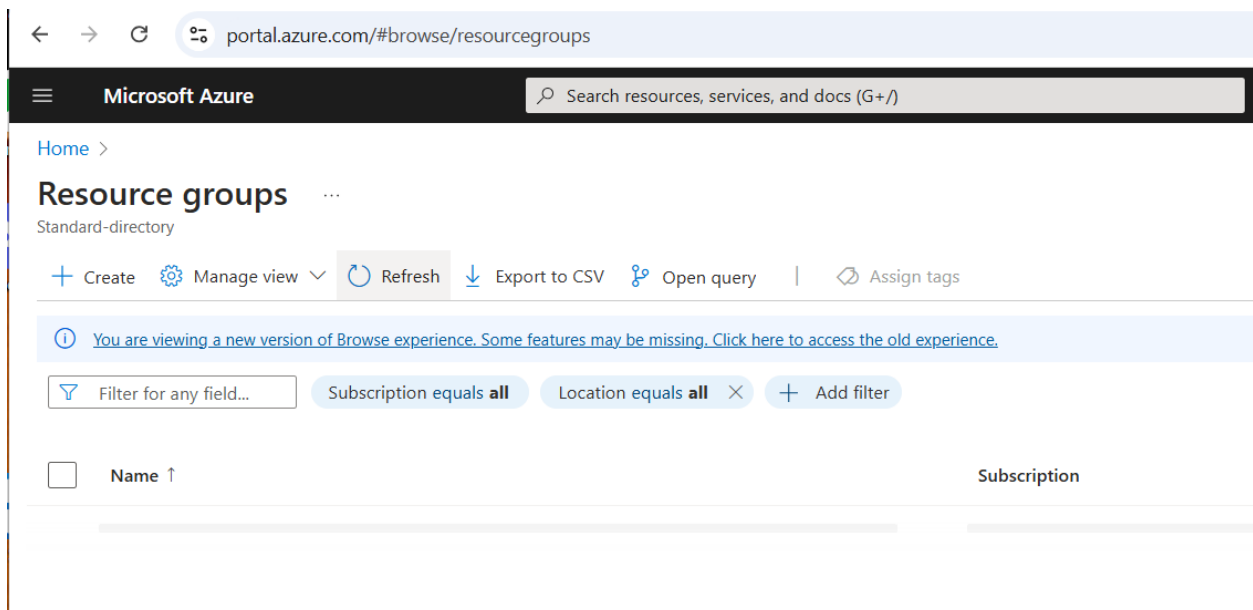

Subjects for today

- Azure AI Services setup
- Running the example code base
- Prerequisites: An active Azure account, preferably with a pay-as-you-go subscription and your own dedicated resource group.
- Get the files you will need for this workshop from here:
<http://panmedia.dk/en-US/rag-workshop>

..and unzip them into a local folder on your disk.

Modular RAGs

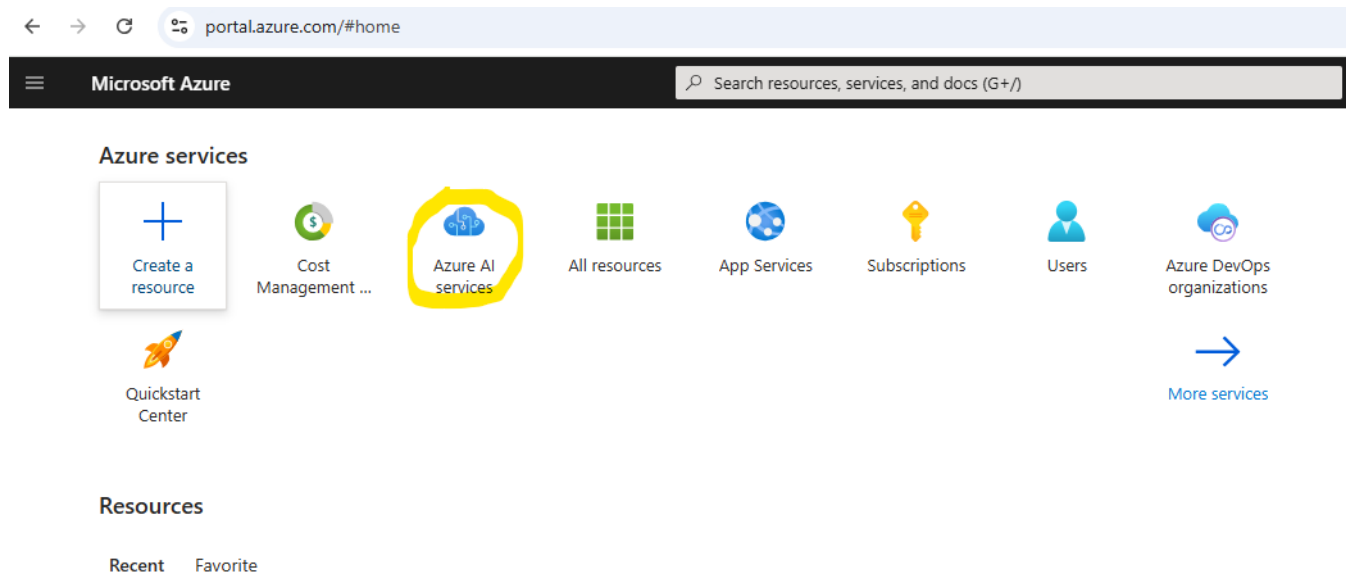

- In order to get the example code up and running on your local machine, you first need to have an active Azure Account – your student account with your institution should work fine. Create a resource group first, as you need to have a place to store your services in. You can create this by searching for ‘resource group’ in the search bar.

The screenshot shows the Microsoft Azure portal interface. The browser address bar displays 'portal.azure.com/#browse/resourcegroups'. The page title is 'Resource groups' under the 'Standard-directory' view. The navigation bar includes 'Home >', 'Microsoft Azure', and a search bar. The main content area features a toolbar with 'Create', 'Manage view', 'Refresh', 'Export to CSV', 'Open query', and 'Assign tags'. A notification banner indicates a new version of the browse experience. Below the notification, there are filter buttons for 'Subscription equals all' and 'Location equals all', along with an 'Add filter' button. The table header shows 'Name ↑' and 'Subscription'.

Modular RAGs

- From your Azure Portal Home Page, pick Azure AI Services.
Link: <https://portal.azure.com/#home>

Modular RAGs

- Bob is your uncle today, because AI Search and Computer Vision, the two main services we need are pretty much at the top of the list.

The screenshot shows the Microsoft Azure portal interface. At the top, there's a search bar for resources, services, and docs. Below that, the 'Azure AI services' section is highlighted in the left-hand navigation menu. The main content area displays a grid of service tiles, each representing a different AI service available on Azure. The tiles include:

- Azure OpenAI account**: Perform a wide variety of natural language tasks.
- AI Search**: Bring AI-powered cloud search to your mobile and web apps.
- Computer vision**: Analyze content in images and videos.
- Face API**: Detect and identify people and emotions in images.
- Custom vision**: Customize image recognition to fit your business.
- Speech service**: Speech to text, text to speech, translation and speaker recognition.

Each tile has a '+ Create' and 'View' button. A notification banner at the top of the main content area states: 'Cognitive Services and AppliedAI Services are now Azure AI services.'

Modular RAGs

- Create a Computer Vision instance.

Be sure to pick the free F0 tier.

The screenshot shows the 'Create Computer Vision' page in the Microsoft Azure portal. The browser address bar shows the URL: `portal.azure.com/#create/Microsoft.CognitiveServicesComputerVision`. The page title is 'Create Computer Vision'. The configuration is as follows:

- Project Details:**
 - Subscription: Pay-As-You-Go
 - Resource group: Panmedia (with a 'Create new' link below it)
- Instance Details:**
 - Region: North Europe
 - Name: Panmedia-Computer-Vision
 - Pricing tier: Free F0 (20 Calls per minute, 5K Calls per month)

Below the instance details, there is a link for 'View full pricing details'. The 'Responsible AI Notice' section contains a paragraph of text and a link for 'Online Services DPA'. At the bottom, there is a checkbox for 'Responsible Use of AI documentation for Spatial Analysis' which is checked, and a confirmation statement: 'By checking this box I certify that I have reviewed and acknowledge the all the terms above.*' with a yellow checkmark icon.

At the bottom of the page, there are three buttons: 'Previous', 'Next', and 'Review + create'.

Modular RAGs

- The Azure AI Search service is a little trickier to set up. Change the price tier via the link at the bottom of the page from standard to..

portal.azure.com/#create/Microsoft.Search

Microsoft Azure Search resources, services, and docs

Modular RAGs

- Setting up a search index is your next task. Simply go to your AI Search instance when the resource is created, and click on 'Add Index' – choose the normal index, not the JSON variant.

Modular RAGs

- Give your Index a memorable name, and click on 'Add Field'.

Microsoft Azure

Search resources, services, and docs (G+)

Dashboard > panmedia-ai-search | Indexes >

Create index

Index name *

Encryption [Microsoft-managed keys](#)

[+ Add field](#) [+ Add subfield](#) [Delete](#) [Autocomplete settings](#)

Field name	Type	Retrievable	Filterable	Sortable	Facetable	Searchable	Analyzer	Dimensions
id	String	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>		

Modular RAGs

- Create an url field. Check all the boxes, so the field gets a standard Lucene analyzer.

Index Field ×

Field name *

Type ⓘ

Configure attributes

Retrievable

Filterable

Sortable

Facetable

Searchable

Analyzer

Modular RAGs

- Create a field 'contentVector' of type Collection(Edm.Single) with the settings shown here, and also create a vector search profile.

Index Field ✕

Field name *

Type ⓘ

Configure attributes

Include in storage ⓘ

Retrievable

Searchable

Dimensions * ⓘ

Vector search profile *

No vector search profiles

[Create](#)

Modular RAGs

- You will also need to create an algorithm configuration for your Vector Search Profile.

Vector profile

Name * ⓘ

vectorSearchProfile

Algorithms *

No algorithm configurations

Create

Vectorizers

No vectorizers

Create

Save

Cancel

Modular RAGs

- The Vector algorithm should have the settings shown here:

Vector algorithm ×

Algorithm name * ⓘ
vector-hnsw-algorithm

Kind * ⓘ
hnsw

Kind parameters

Bi-directional link count (m) ⓘ
4

efConstruction ⓘ
400

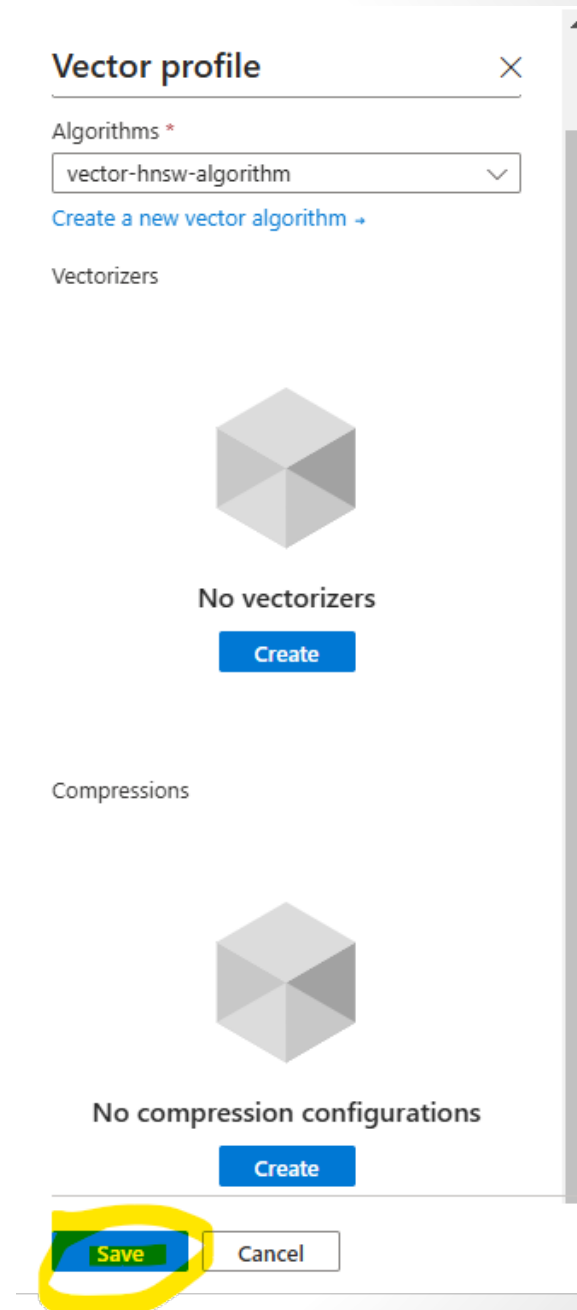

efSearch ⓘ
500

Similarity metric ⓘ
cosine

Modular RAGs

- Now you need to save your new Vector profile – make sure that your algorithm is selected in the dropdown box and click Save.

You don't need to create a Vectorizer or a Compression configuration.

Vector profile ×

Algorithms *
vector-hnsw-algorithm ▾

[Create a new vector algorithm →](#)

Vectorizers

No vectorizers
[Create](#)

Compressions

No compression configurations
[Create](#)

[Save](#) [Cancel](#)

Modular RAGs

- Now the system will return to the previous screen, and you can save the contentVector index field, along with the Vector profile you have just created. NB: **make sure** that the boxes are ticked here!

Index Field ✕

Field name *

Type ⓘ

Configure attributes

Include in storage ⓘ

Retrievable

Searchable

Dimensions * ⓘ

Vector profile * ⓘ

[Create new vector profile →](#)

Modular RAGs

- Lastly, you need to create the index. If you have made the index precisely as indicated in the previous screendumps, the boxes are ticked as shown here, and you can hit 'Create'. **NB: if you click any of the checkboxes in this view, you have to make the index from the starting point again** – it's a bug in the Azure interface, sorry guys 😞

Microsoft Azure

Search resources, services, and docs (G+)

Home > panmedia-ai-search >

contentVector	SingleCollection	<input checked="" type="checkbox"/>				<input checked="" type="checkbox"/>		1024

[Create](#) [Cancel](#)

Modular RAGs

- Now, you can set up your unique API keys and endpoints from your own Azure account in the two solution projects. The appsettings.json file in the Console project:

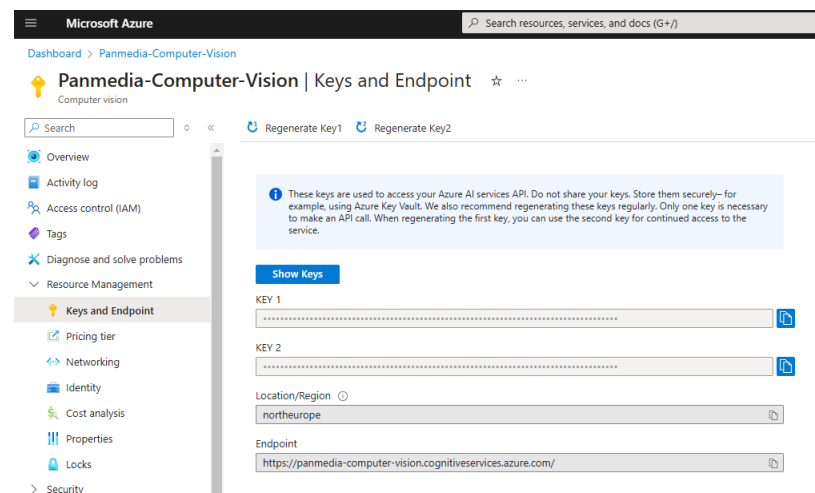

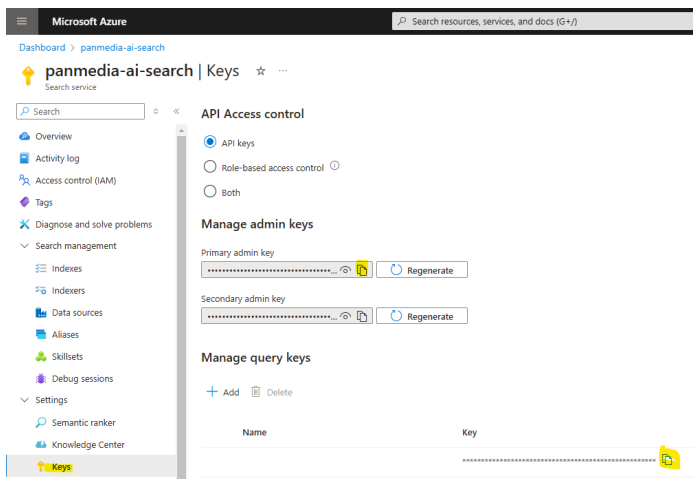

```
appsettings.json
Schema: https://json.schemastore.org/appsettings.json
1  {
2    "AzureComputerVisionEndpoint": "https://xxxxxxxxxxxxx.cognitiveservices.azure.com",
3    "AzureComputerVisionKey": "YOURKEYHERE",
4
5    "AzureAiSearchEndpoint": "https://xxxxxxxxxxxxx.search.windows.net/indexes/my-index/docs/index?api-version=2023-11-01",
6    "AzureAiSearchKey": "YOURKEYHERE",
7
8    "AzureBlobContainerUrl": "https://xxxxxxxxxxxxxxxxxxxxx.blob.core.windows.net/images"
9  }
```

.. and the appsettings.json file in the WebApplication project:

```
appsettings.json
Schema: https://json.schemastore.org/appsettings.json
1  {
2    "Logging": {
3      "LogLevel": {
4        "Default": "Information",
5        "Microsoft.AspNetCore": "Warning"
6      }
7    },
8    "AllowedHosts": "*",
9    "AzureComputerVisionEndpoint": "https://xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx.cognitiveservices.azure.com",
10   "AzureComputerVisionKey": "YOURKEYHERE",
11
12   "AzureAiSearchEndpoint": "https://xxxxxxxxxxxxxxxxxxxxxxxxxxxxx.search.windows.net/indexes/my-index/docs/search?api-version=2023-11-01",
13   "AzureAiSearchKey": "YOURKEYHERE"
14 }
15
16
17 }
```

Modular RAGs

You can copy the keys and endpoints you need from each resource from Settings >> Keys and Resource Management >> Keys and Endpoints. Click on the icon marked with yellow to copy the key to the clipboard.

Modular RAGs

NB: the search endpoint in the console app indexer is special:

"AzureAiSearchEndpoint":

https://YOUR_NAMED_SEARCH_INSTANCE.search.windows.net/indexes/YOUR_NAMED_INDEX/docs/index?api-version=2023-11-01

Here, you can set up your own names instead of the capital letters.

Modular RAGs

- Important: set your primary admin key for ai search in the Console project, and use the more lowly query key in the Web project. If you don't, the Console App will not index correctly.

Microsoft Azure

 📄

Modular RAGs

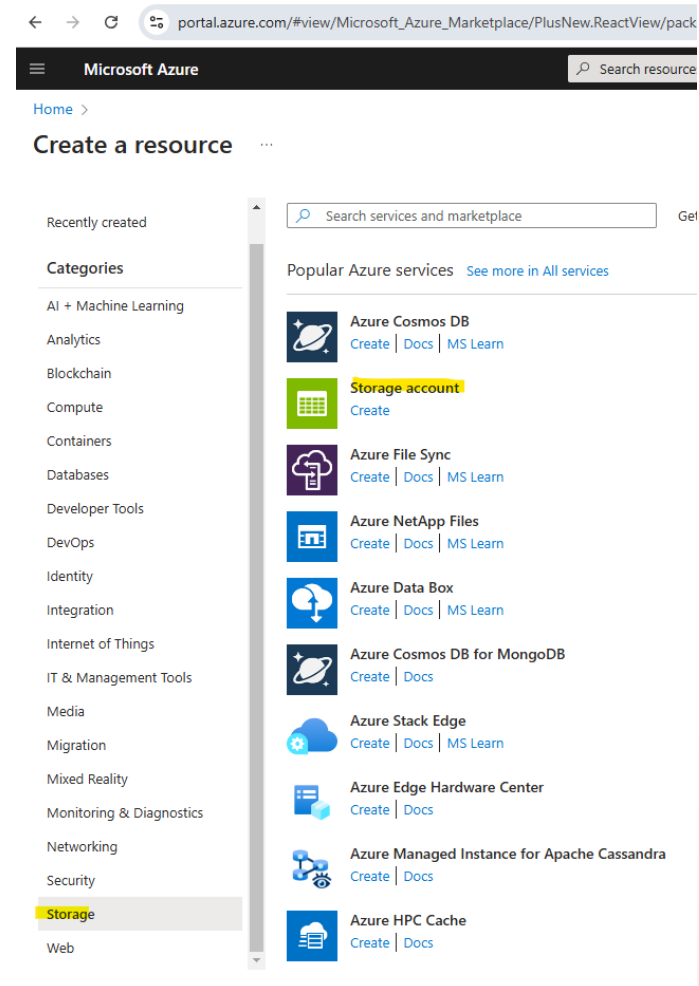

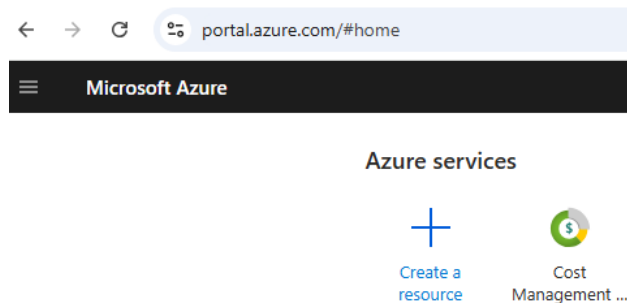

- In the file 'VectorRepository.cs' in the Web project, you can play around with the value for k in line 28 to 4 or 5 instead of 3. This will later bring up three, four or five pictures from the urls in the search index. There aren't many images though in the sample folder, and with the value of 3 you will see less 'hallucinatory' pictures at the bottom of the list 😊

```
VectorRepository.cs | VectorSearchController.cs | appsettings.json | appsettings.json
WebApplication | WebApplication.Models.VectorRepository | DoVectorSearch(string searchPrompt, string conf)
15 |
16 |
17 |     var textVector = await TextEmbedding(searchPrompt, conf);
18 |
19 |     var payload = new
20 |     {
21 |         vectorQueries = new[]
22 |         {
23 |             new
24 |             {
25 |                 kind = "vector",
26 |                 vector = textVector,
27 |                 fields = "contentVector",
28 |                 k = 3
29 |             }
30 |         },
31 |         select = "id, url",
32 |         count = true
33 |     };
34 |
35 |     HttpRequestMessage message = new HttpRequestMessage()
36 |     {
```

Modular RAGs

- Now for the pretty pictures part. You will need to set up a small blob storage on Azure, since the indexing we need to do is a lot easier on that platform. Go to <https://portal.azure.com/#home>, and click on 'Create a resource'. Then choose 'Storage Account'.

Modular RAGs

If you are unable to create a Blob storage container on your standard Azure student account – I know this can be pretty troublesome - then you can use my Blob storage account in the appsettings.json file:

```
s AzureOpenAiService.cs appsettings.json
https://json.schemastore.org/appsettings.json
8   "AzureBlobContainerUrl": "https://panmediablob.blob.core.windows.net/images"
9   }
10
```

If you want to try to create your own Blob storage container, you can proceed with the next six slides.

Modular RAGs

- I chose the cheapest possible options. Don't worry too much here, it most probably isn't going to break the bank account, but it is necessary in order to make the App work.

portal.azure.com/#create/Microsoft.StorageAccount

Microsoft Azure Search resources, services, and docs (G)

Home > Create a resource >

Create a storage account

Basics Advanced Networking Data protection Encryption Tags Review + create

Azure Storage is a Microsoft-managed service providing cloud storage that is highly available, secure, durable, scalable, and redundant. Azure Storage includes Azure Blobs (objects), Azure Data Lake Storage Gen2, Azure Files, Azure Queues, and Azure Tables. The cost of your storage account depends on the usage and the options you choose below. [Learn more about Azure storage accounts](#)

Previous Next Review + create

Modular RAGs

- Next, we will need a container for our images. Click on the plus sign next to 'Container', and select the most permissive anonymous access level, since we want our Console App to be able to see and enumerate the container contents.

The screenshot shows the Microsoft Azure portal interface. At the top, there is a search bar and a 'Copilot' button. The main content area displays the 'Containers' page for a storage account named 'panmediablob'. A 'New container' dialog box is open, showing the following details:

- Name:** rag-images
- Anonymous access level:** Container (anonymous read access for containers and blobs)

A warning message is displayed below the dropdown menu:

⚠ All container and blob data can be read by anonymous request. Clients can enumerate blobs within the container by anonymous request, but cannot enumerate containers within the storage account.

The background shows the Azure portal navigation menu and a table of existing containers:

Name	Last
<input type="checkbox"/> \$logs	11/1
<input type="checkbox"/> images	11/1

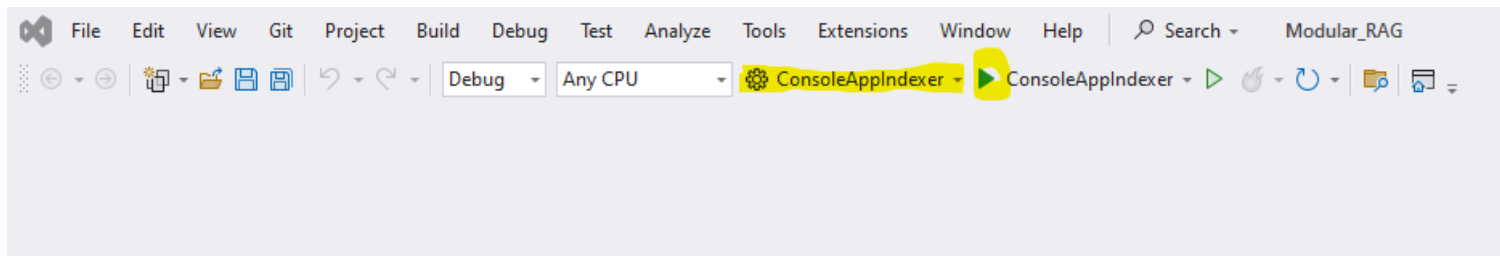

Modular RAGs

- Take the images from the zip file you have downloaded - and upload them into your container. There should be 60 images in all.

The screenshot displays the Microsoft Azure portal interface for a container named 'images'. At the top, there is a search bar for resources, services, and docs. Below the navigation bar, the breadcrumb path is 'Home > panmediablob | Containers >'. The container name 'images' is prominently displayed with a 'Container' label underneath. A search input field is present. Action buttons include 'Upload', 'Change access level', and 'Refresh'. The 'Authentication method' is set to 'Access key' with a link to 'Switch to Microsoft', and the 'Location' is 'images'. A search bar for blobs by prefix is also visible, along with an 'Add filter' button.

Modular RAGs

- Now, with the keys and endpoints correctly set up in both instances of appsettings.json, we should be able to run the indexer from the console. The project you have downloaded will need to be set to 'ConsoleAppIndexer' in the dropdown in VS 2022, and you can click on the green triangle to run the indexer.

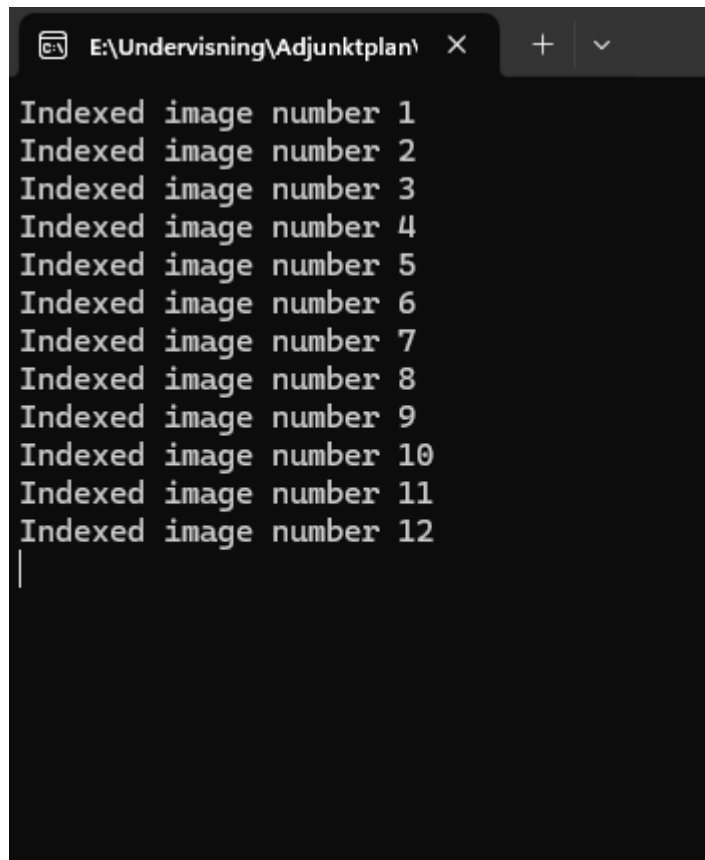

- If it doesn't work as expected, get my attention and I will take a look at your setup.

Modular RAGs

- If everything is working, you should see the indexer crawling the Azure Blob store image container:

There is a delay of three seconds between each index entry produced, because the free tiers of the services we are using have a limit of 20 requests per minute. Let the indexer do its job in the foreground and leave your machine to it until 60 images have been processed.

A terminal window with a dark background and light text. The title bar shows the path 'E:\Undervisning\Adjunktplan\' and window controls. The output consists of 12 lines, each starting with 'Indexed image number' followed by a number from 1 to 12. A vertical cursor is visible at the end of the 12th line.

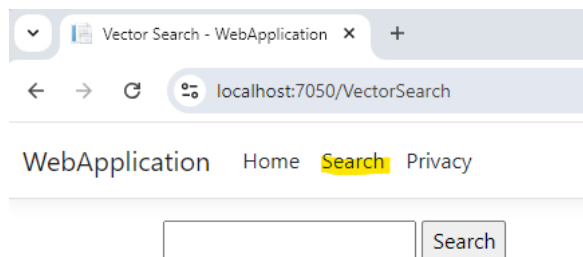

```
E:\Undervisning\Adjunktplan' x + v
Indexed image number 1
Indexed image number 2
Indexed image number 3
Indexed image number 4
Indexed image number 5
Indexed image number 6
Indexed image number 7
Indexed image number 8
Indexed image number 9
Indexed image number 10
Indexed image number 11
Indexed image number 12
|
```

Modular RAGs

- Once the indexer is done, choose the Web Application from the top menu, and click on the green triangle to start the Web App.

- Click on 'Search' to enter a search term for an animal.

Modular RAGs

- Here, I have searched for cats:

WebApplication [Home](#) [Search](#) [Privacy](#)

give me cats

Modular RAGs

- .. and here I have searched for crabs. The vector search will return the highest probability of a match first (the only picture of a crab in the image collection) and it will 'hallucinate' the closest match it thinks it can find for the next two images.

WebApplication Home Search Privacy
